

Bottlenose Dolphin

Coloring Instructions: Color the chin and belly white or light pink. Color the rest of the dolphin gray.

Interesting Fact: Dolphins use echolocation, or sound waves, to locate food and detect dangers. They make a sound which travels through the water. If this sound wave hits a school of fish, the sound bounces back to the dolphin, telling it that a school of tasty fish is nearby. If instead, the sound wave runs into a shark, it bounces back telling the dolphin a dangerous predator is nearby.
