

# Zebra Longwing

**Coloring Instructions:** Find the tiny spots along the middle of the butterfly's body (not on its wings). Color these tiny spots red. All of the other lines and spots should be bright yellow.

**Interesting Fact:** Most butterflies only drink nectar as food. In addition to nectar, the Zebra Longwing butterfly also collects pollen on its long curly tongue. Since butterflies can't chew, the Zebra Longwing must spit digestive juices onto its tongue to dissolve the powdery pollen. When the pollen becomes a liquid, the butterfly slurps it up. This extra pollen protein may explain why Zebra Longwings live 5-6 months when most butterflies only live for a few weeks.
